Introduction

Purpose & description

This application is a React-based single-page web page designed to allow users to explore Australian rental property data through an interactive and user-friendly interface. The system integrates with a REST API to retrieve listings, and enables users to search, filter and view detailed information about properties across different states. Additionally, the application support user authentication, allowing registered users to log in and out. The application is designed to support smooth and dynamic user experience by utilising modern web technologies such as React, React Router, and API-driven data handling.

The main highlight of the application is its strong focus on usability and responsiveness. The interface is implemented as a single-page application (SPA), enabling smooth navigation without full page reloads and creating a seamless user experience. A clean and modern UI design further enhances usability, making it intuitive for users to interact with the system. The search and filtering functionality has been designed with simplicity in mind, allowing users to quickly refine results without unnecessary complexity. In addition, an infinite scrolling mechanism is used to efficiently handle paginated data from the API, improving both performance and user engagement by loading results dynamically as the user navigates through the listings.

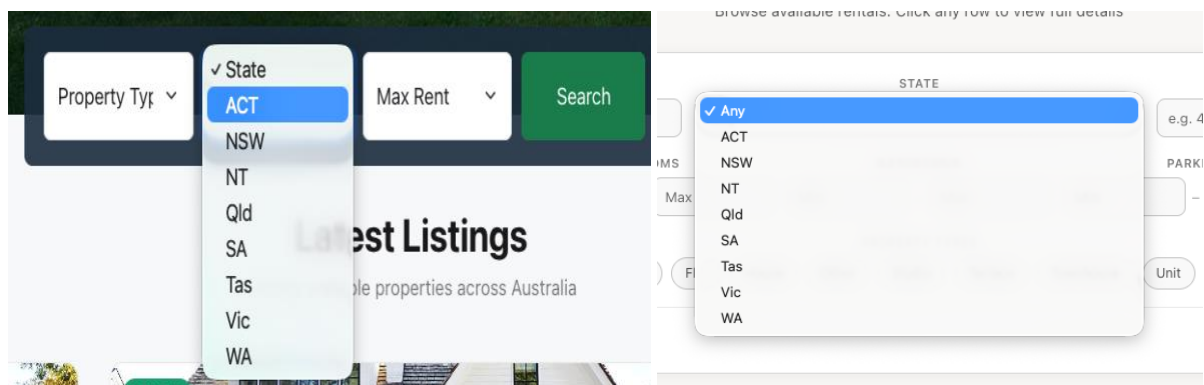

Completeness and Limitations

In the application, majority of the required functionalities required in the assignment specification are successfully implemented. All core API endpoints are managed, including rental search, detailed rental views, and user ratings. Users can effectively use searching and filtering functionalities with ease. The application is well-structured, overall design and responsiveness meet the expected standard, providing a smooth and intuitive user experience.

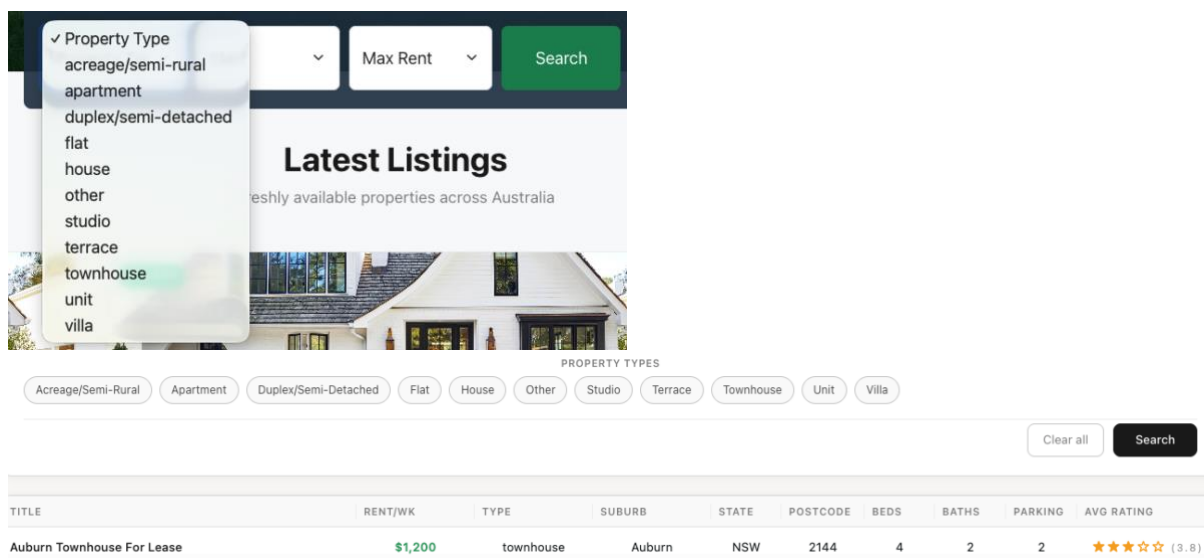

One limitation of the application lies in the authentication workflow. While user registration and login are implemented and generally function as expected, there are occasional inconsistencies in token handling and session persistence, particularly when the page is refreshed. This can temporarily affect access to authenticated features such as submitting ratings or retrieving rated rentals. Despite this limitation, the core functionality of the system remains stable, and the application demonstrates a high level of completeness in both feature implementation and overall usability.

Use of End Points

</rentals/states>

This endpoint is used to retrieve the names of the states for filtering and searching in webpages

</rentals/property-types>

This endpoint is used to retrieve the names of the rentals' property types for filtering and searching purposes in the web application.

AG Grid Community

Powerful data grid library for displaying and managing tabular data with sorting, filtering, and editing features

<https://www.ag-grid.com/react-data-grid/>

AG Grid React

React wrapper for AG Grid, enabling integration of AG Grid functionality into React applications

<https://www.ag-grid.com/react-data-grid/react-data-grid/>

Pigeon Maps

Lightweight React library for interactive maps with markers and overlays

<https://pigeon-maps.js.org/>

Navigation and Layout

allowed for faster development while still providing essential functionality such as filtering, sorting, and structured data presentation.

Usability and Quality of Design

The application is generally well organised, with a clean structure that separates search, results, and property details into clear sections. UI components such as cards, icons, and tables are appropriate for the type of data being displayed and help users quickly understand key information. Navigation is fast and mostly intuitive due to the single-page application approach, and the overall flow aligns with common user expectations from similar rental platforms. This makes the application easy to learn and use at a basic level.

However, there are several potential usability issues that might affect the overall quality of the design. The landing page places too much emphasis on a quite big hero section with text, while the search functionality is less visible. This can slow down users who expect to start searching immediately. Additionally, navigation lacks clear visual sign that tells the user where they are directed, and this makes it difficult for users to recognise which page they are currently on after a transition. The visual design is mostly consistent, but there could be minor inconsistencies in font sizes and styling across screens, and some layout elements might be on fixed sizes, which can reduce responsiveness on different devices.

These issues highlight compromises made during development, particularly due to time constraints. To improve usability, the search functionality should be prioritised on the landing page, navigation should include clearer indicators such as active states or page headings, and typography should be standardised across the application. Improving responsiveness by reducing fixed sizing would also enhance the overall experience. While the current design meets basic usability expectations, these changes would make it more polished, consistent, and user-friendly.

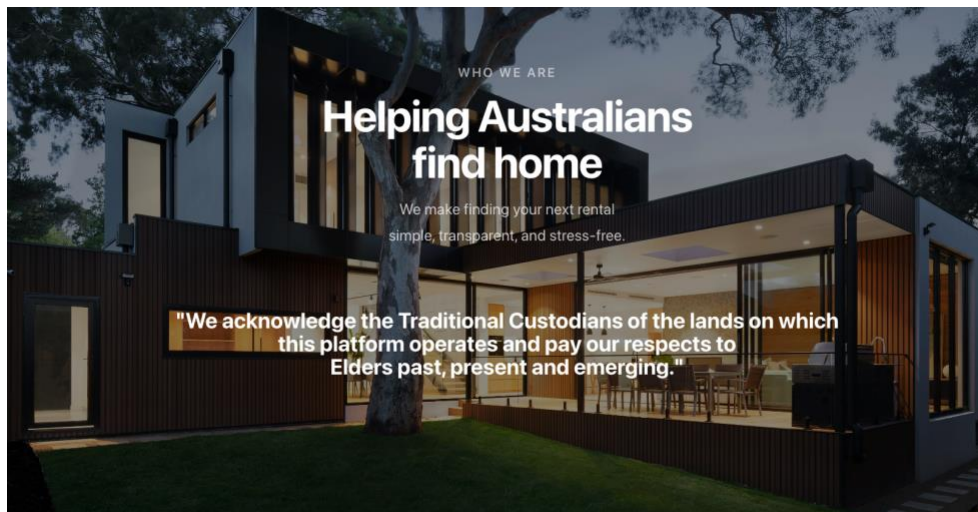

Accessibility

All images in the application include appropriate alt text, ensuring they can be interpreted by screen readers for visually impaired users. Error handling is implemented across interactive features, with visible error messages displayed when operations fail, preventing silent failures. In terms of readability without stylesheets, the application remains largely understandable due to a logical HTML structure, although components like AG Grid tables and filter panels lose visual organisation when styles are removed. Dynamic content is also handled effectively, with loading and empty states clearly communicated through AG Grid overlays, ensuring users are always informed of system status.

Colour usage is generally functional but presents minor accessibility limitations. Property type filters rely mainly on background colour changes to indicate selection, which may not be fully distinguishable for colour-blind users. Although a “Clear All” option provides an alternative way to reset filters, selection states could be improved by adding secondary indicators such as borders or icons. The language used throughout the application is simple, direct, and consistent, using plain Australian English to ensure accessibility for a general audience without technical complexity. An

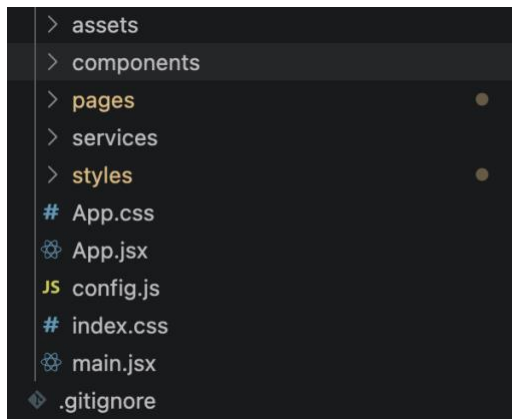

earlier issue with screen flickering caused by repeated state updates was resolved by using AG Grid's built-in overlay system, improving stability and user experience.

From a cultural and accessibility perspective, the application operates as a national rental platform covering properties across Australia, including areas on Aboriginal and Torres Strait Islander Country. An Acknowledgement of Traditional Owners has been added to the About page, recognising the importance of land and culture in Australia. However, beyond this, the platform does not actively incorporate further cultural design considerations. The system is lightweight and performs well on slower connections, making it suitable for regional use, but it remains fully dependent on JavaScript and does not include a non-JavaScript fallback, which could limit accessibility on older or restricted devices.

Technical Description

Architecture

The application is a React Single Page Application built with Vite, organised within a `src` directory split across six folders as shown below.

assets/ stores static media files — primarily the hero background image and any other images referenced directly in components.

pages/ contains one `.jsx` file per route: Home, About, Login, Register, RentalSearch, Rentals, and RatedRentals. Each page is responsible for its own data fetching and rendering. React Router maps URLs to these components in `App.jsx` using `createBrowserRouter`, with a catch-all `path="*"` handled in `services`.

components/ holds reusable UI pieces shared across pages — Navbar, Footer, and `AppLayout`. `AppLayout` acts as the root layout wrapper, rendering the Navbar and Footer around every page via React Router's `<Outlet>`.

services/ contains cross-cutting logic that is not tied to a single page. `AuthProvider` is a React Context that wraps the entire application and exposes the current user and JWT token globally, so any page can access authentication state without touching `localStorage` directly. `NotFound` component redirects users which has entered the unavailable route url. A description utility function handles string formatting for the Rental detail page, and map handling logic supports location display.

styles/ separates CSS into per-page and per-component files (`global.css`, `rental-search.css`, `login-register.css`, `rental-page.css`) keeping styles scoped and easy to maintain independently.

config.js exports a single `API_URL` constant pointing to the backend server, used in every fetch call across the application so the base URL is never hardcoded in individual files.

Data and control flow: A user navigates to a route → React Router renders the matching page component → the page fetches data from the REST API using `fetch` with the `API_URL` → the response is stored in local `useState` and rendered. For protected pages like `RatedRentals`, `AuthProvider` checks for a valid JWT token and `NotFound` handles if url is absent. The Navbar reads from `AuthProvider` to conditionally show login/logout options based on session state.

Test plan

[illegible]

Difficulties / Exclusions / unresolved & persistent errors /

The most significant roadblock encountered during development was implementing AG Grid's infinite row model correctly. Early attempts passed the raw fetch function directly as the datasource prop, which is incorrect — AG Grid requires a specific object shape with a `getRows` method that receives `startRow`, `endRow`, `successCallback` and `failCallback` parameters. Further complications arose from mismatches between the API's fixed page size and AG Grid's `cacheBlockSize` setting, which caused rows to appear in isolated patches with large empty gaps between them. A related issue was grid flickering caused by the datasource object being recreated on every React render, which triggered an infinite re-fetch loop. This was resolved by storing the datasource in a `useRef` so it is created only once, and switching from React-managed loading state to AG Grid's native overlay API to avoid state-driven re-renders.

One area of partially unresolved functionality is the `RatedRentals` page, where each row makes an individual API call to `/rentals/:id` to resolve the rental title from the `rentalId` — since the ratings endpoint does not return the title directly. This means if a user has many rated rentals, the page fires a large number of sequential fetch requests on load, which is inefficient. A better solution would be for the backend to return the title alongside each rating, but as this is a fixed external API it cannot be changed. Additionally, the custom CSS spinner defined in the `overlayLoadingTemplate` of `RentalSearch` references a `spin` keyframe animation that is defined in the stylesheet, but inline HTML strings inside AG Grid templates do not have access to external stylesheets, so the spinner renders without animation — a known limitation of AG Grid's overlay system.

Extensions (Optional)

User guide

To begin using the application, open the home page (Screen 1) where you are presented with a navigation bar containing links to **About**, **Login**, **Register**, and **Rental Search**, as well as a central **Advanced Search** button. Clicking either the Advanced Search button or the Rental Search nav link takes you to the search page (Screen 4), where you can filter rentals by state, property type, and other criteria using the filter panel on the left. Results appear as a list on the right, and clicking any row navigates you to the full property detail page (Screen 5), which displays pricing, bedrooms, bathrooms, parking, amenities, a description, agency contact details, and an interactive map. If you wish to learn more about the platform first, the **About** link in the navbar takes you to Screen 2, from which you can also navigate directly to the search page.

To access authenticated features, click **Login** or **Register** from the navbar (Screen 3). Fill in your credentials and submit — on success you will be taken to your **My Rated Rentals** dashboard (Screen 6), which displays a grid of all properties you have previously rated. If you attempt to rate a property on Screen 5 without being logged in, the app will automatically redirect you to the login page and return you to the property afterwards. Once logged in, clicking **Rate this property** on any rental page
